Problem – Solution Fit Template:

Problem-Solution Fit

Problem-Solution Fit means understanding a specific customer problem and developing a solution that directly addresses that problem. It confirms that the proposed solution is useful, practical, and relevant to the target users.

Purpose:

- Identify the main problems and challenges faced by the target customers. Develop a simple and effective solution that meets customer needs.
- Understand customer behavior, expectations, and common difficulties. Improve user satisfaction by solving important and frequent problems. Build trust by providing a reliable solution to real customer needs.
- Make the solution easier for customers to understand, access, and use. Collect customer feedback and continuously improve the solution.
- Ensure that the final product provides real value to the target users.

Template:

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) CS Who is your customer? I.e. Backend developers, SaaS founders, indie hackers, content agencies building automation pipelines using NestJS.	6. CUSTOMER CONSTRAINTS CC What constraints prevent your customers from taking action or limit their choices of solutions? I.e. Budget (token costs), time to build, need for specific tech stack (NestJS/Type-safe), limited in-house AI expertise, data privacy concerns.	5. AVAILABLE SOLUTIONS AS Which solutions are available to the customers when they face the problem or need to get the job done? I.e. Raw OpenAI API/SDKs (no context or error handling), general AI writing tools (Jasper, Copy.ai), no-code automation (Make, Zapier), or building everything from scratch.	Explore AS, differentiate
	2. JOBS-TO-BE-DONE / PROBLEMS J&P Which jobs-to-be-done (or problems) do you address for your customers? I.e. Automatically generate high-quality, SEO-optimized blog posts via clean API calls; avoid boilerplate setup for AI integration; ensure consistent output format.	9. PROBLEM ROOT CAUSE RC What is the real reason that this problem exists? I.e. LLMs are non-deterministic, making them difficult to integrate into robust applications; lack of a specialized framework for AI content production within existing apps.	7. BEHAVIOUR BE What does your customer do to address the problem and get the job done? I.e. Tries to build a proof-of-concept; tests raw prompts in playgrounds; searches for NestJS-AI starter kits; reads about prompt engineering.	
Identify strong TR & EM	3. TRIGGERS TR What triggers customers to act? I.e. A developer needs to add an AI feature to a CMS; a startup wants to automate marketing content; a need for structured AI content without complex prompt engineering.	10. YOUR SOLUTION SL I.e. A complete, production-ready NestJS API module for AI-powered blog generation, featuring: structured output DTOs, prompt templates, built-in SEO tools, and asynchronous generation using Queues.	8. CHANNELS OF BEHAVIOUR CH 8.1 ONLINE I.e. Search engines, developer forums (Stack Overflow, Reddit), social media (X/Twitter devs), GitHub, tech blogs.	Extract online & offline CH of BE
	4. EMOTIONS: BEFORE / AFTER EM How do customers feel when they face a problem or a job and afterwards? I.e. From frustrated (by LLM formatting hallucinations and rate limits) to relieved and confident (with reliable, type-safe API output and robust NestJS modules).		8.2 OFFLINE I.e. Tech meetups, hackathons, developer conferences, in-person co-working.
